

**Auxiliary flasher indicator on the crash helmet**

- 5 The flasher indicators or receivers (1) (Fig. 1), which are illuminated by means of light-emitting diodes and/or incandescent bulbs (2) and which are controlled by a transmitter (radio or infrared) (5), are operated by means of replaceable batteries and/or rechargeable accumulators (3),  
10 which in turn can be directly recharged at the vehicle electrical system, domestic power supply and/or through solar cells (4), which are likewise attached to the helmet, receive their impulse for flashing from a transmitter (radio or infrared) (5), which in turn receives its impulse from the  
15 flasher relay of the motorcycle, may, for example, be placed at or in the rear light (6) or mudguard (7) (Fig. 2) or at another suitable position.

When in position, the flasher indicator or receiver (1) can  
20 also be activated by a contact switch (8) in the helmet and/or a switch (9), to be manually operated, at the helmet or flasher indicator or receiver (1).
